

The advantage of degradable plastic bags is that they can be broken down by the natural environment, thereby reducing the long-term impact on the environment.

However, the disadvantages of degradable plastic bags include: Firstly, they often require more food consumption; Secondly, although degradable, these products may still cause visual pollution; Thirdly, due to technical limitations, even if degradable plastic bags are used, potential environmental risks still exist; Finally, due to the addition of special chemicals, these plastic bags are difficult to be recycled and reused.
